ISA · AI-ENABLED CHAPTER SUPPORT · WEEKLY UPDATE

# November 4, 2026

What we built this week, at a glance · from Second Star Collective

**131**
approved passages, now searched by meaning

**61 / 61**
rule checks passed on start-up, no problems

**~200**
languages the translation model can switch on

**3**
ways for a leader to reach a person

## How Isa answers a question

**1. Rules**
Decide whether Isa answers, answers and points to a person, or passes it on.

›

**2. Search**
Finds the approved passages closest in meaning to the question.

›

**3. ISACA's words**
If a passage answers directly, Isa shows ISACA's own text.

›

**4. AI wording, only if needed**
When the answer is spread across passages, the AI puts it together.

›

**5. Checks**
Every AI sentence is checked against its source.

›

**6. The leader**
Gets the answer, ISACA's exact words, or a person.

All of Isa's AI runs on our own computers. No ISACA text is sent to an outside AI service.

## This week

### Search by meaning

BUILT · CONNECTING

Each approved passage is turned into 768 numbers that capture its meaning, and so is each question. Isa finds the closest passages even when they share no words with the question, so leaders don't have to guess the guidebook's exact wording.

Only approved passages can come back. If none is a good enough match, Isa says she couldn't find the answer in ISACA's documents, rather than guessing.

### Checking answers

BUILT · TESTING

When the AI words an answer, a separate checking model scores each sentence from 0 to 1 for whether its source supports it. Numbers, dates and contact details must match the source, and "must" cannot be softened.

Each answer gets a confidence score. If the wording doesn't pass, Isa quotes ISACA's exact words or passes the question to a person. Both pass marks are adjustable on a dashboard, with no restart.

### Clear rules for what Isa will and won't answer

SELF-TEST PASSING

Written rules decide, for each kind of question, what Isa does. A rule can cover every chapter, one region or country, or a single chapter. A local rule can add caution but can never remove a protection that applies more widely.

13 sample rules, each with test questions. Files without an approval record are refused. A tester shows what Isa would do with any question, and which rule decided it. In a real deployment, ISACA would write and approve the rules.

### Translation

WORKING

Translation works end to end, in many languages. It uses a translation model that runs on our own computers and covers about 200 languages, and we can switch any of them on.

If the model isn't available, Isa shows the original English and says so, rather than pretending she translated it.

### Three ways to reach a person

WORKING

Under every answer, a leader can tell Isa whether she helped; if not, she offers to pass it on. "Talk to a person" is always at the bottom of the chat. When an answer also needs a human view, Isa offers a button to pass it to the Chapter Experience team.

The leader decides what goes with the request, and nothing is sent until they press send. Each hand-off gets a reference number and can open a case in Salesforce.

### Room to grow

WORKING

Isa's heavier AI services can run on a separate, more powerful computer of our own, over a private, encrypted network. No outside service is involved.

An administrator chooses on the dashboard where the services run and can switch voice and translation on or off. The chat stays light, so Isa grows by adding capacity where it's needed.

### Privacy in the logs

BUILT

Every check Isa runs is recorded, so we can always see why she answered the way she did. The records hold counts and categories only, never a leader's words.

Isa is a prototype. The rules, sample people and settings shown here are ours, for demonstration. A real deployment would use ISACA's own approved content, rules and systems.
